CATALYTIC ACTIVITY: ATP + (deoxyribonucleotide)(n) + (deoxyribonucleotide)(m) = AMP + diphosphate + (deoxyribonucleotide)(n+m).
BIOPHYSICOCHEMICAL PROPERTIES:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to 100 degrees Celsius. Thermostable;
SUBUNIT: Monomer.
SIMILARITY: Belongs to the ATP-dependent DNA ligase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Temperat

promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant having an improved property comprises transforming a transformed plant having an improved property comprises transformed plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nyaroxy ester by reducing an alpha-keto ester using a ket enzyme. The present sequence represents a Sporobolomyces ketoreductase, aldehyde reductase II, N-terminal peptide method of the invention.
                                                                                                                                                                                                                                    New

diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                        wpi;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       form pa

diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY38794
                                                                                                                                                                                  Amino acid sequences AAY38499-Y38944 represent Neisseria meningitidis N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments their nucleic acids and antibodies are used for diagnosis, prevention vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragmer of the nucleic acids are useful as hybridisation probes and antisense reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY3879

                                                                                                                                                                                                                                                                                                                                                                                         iion relates to an isolated nucleic acid molecule. The methods sitions of the present invention are useful for diagnosing sating Neisserial bacterial infections, in particular meningitis semia caused by Neisseria meningitidis and Neisseria gonorrhea. It sequence represents the amino acid sequence of a N. It septence of a N. It septence in the sequence data for this patent did not form the printed specification, but was obtained in electronic formatic printed specification.
                                                                                                                                                                                                                                                                                                           48.6%; milarity 47.4%; Conservative

The methods and compositions of the present invention are useful for diagnosing and/or treating Neisserial bacterial infections, in particular meningitis and septicemia caused by Neisseria meningitidis and Neisseria gonorrhea. The present sequence represents the amino acid sequence of a N. gonorrhoeae protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequanta.uspto.gov/sequence.html?DocID=6914131B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Neisserial nucleic acids useful is bacterial infections, in particular renewals in the serial meningitidis and Neisseria

Also disclosed are the nucleic acid molecules encoding the proteins an antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention

                                                               sequences AAY38499-Y38944 represent Neisseria meningitidis and sae antigenic proteins. They are encoded by open reading ) AAZ11972-Z12358. The antigenic proteins, their fragments, cacids and antibodies are used for diagnosis, prevention (as treatment of Neisseria infections, such as meningitis, and gonorrhea. Both organisms are closely related. Fragments sic acids are useful as hybridisation probes and antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                        ğ

diagnosis,
                                                                                                                                                                                                                                                                             Amino acid sequences AAY38499-Y38944 represent Neisseria meningitidis N. gonorrhoeae antigenic proteins. They are encoded by open reading frames (ORFs) AAZ11972-Z12358. The antigenic proteins, their fragments their nucleic acids and antibodies are used for diagnosis, prevention vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragmer of the nucleic acids are useful as hybridisation probes and antisense reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neisseria

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
